Train the base resenet18 model on dataset , we are seeing good training and validation accuracy , but by observing val loss , we can say model is trying to overfit on train data so we are getting increasing loss invalidation

I have deployed model on hugging face and it is running perfectly

After Simulate data drift by changing brightness or adding noise we are seeing it .

When loss is greater we are getting alert :

Accuracy drop under drift:
drift_eval_noise_std_0.10

Baseline acc=0.5175, drifted acc=0.2302, abs_drop=0.2873, rel_drop=55.52%
